SOURCE

1. According to the balance figures submitted to the Planning Commission for 1949 the maximum output of the Trbovlje coal mine was reached on 1 October 1949 at which time it amounted to 150 carloads. This figure was compared by the Planning Commission with the prewar figures and it was established that on 1 October 1940 the output of the mine had amounted to 450 carloads per day.
2. The coal mined is to some extent used in the thermo-electric plant of Trbovlje, which has a power of 36,000 kilowatts. The remaining coal is shipped to other industrial enterprises and is also assigned to the railroads. The coal is not exported because of the low output and because of the requirements on the industrial market.
3. The Trbovlje mine has two pits, a western and an eastern pit (named Anzer and Terezija by the Germans), and a third pit named Dobrna, the latter being mined on a daily basis. The western pit supplies 50 percent of the total output, the eastern pit 38 to 40 percent, and the third pit 10 to 12 percent. In 1949, approximately 1,700 men were employed in the mine. Anton Rizek, a Communist, is the director of the mine, and his assistant, Janez Irt, is likewise a Communist. The chief engineer is Dinko Prezelj.
